# What's new in ShipIT version 4.0 (F2)
WEB SERVICES

In this document you will find an overview of the adjustments to the web services for ShipIT version 4.0 F1. Please refer to the web services documentation for detailed information.

To see which version your assigned backend is running in, enter the backend URL to a browser: https://shipit-wbm-preview01.gls-group.eu:8443/*backend/backendinfo/name*.

Disclaimer

- This is the second **pre-release version of 4.0**. In the future we might have several of these short release cycles applied to our **webbackends**. The decision to which backend this version is deployed on, is taken by GLS countries. To **see the currently applied version**, enter the webbackend URL to a browser followed by /backend/backendinfo/name (e.g. https://shipit-wbm-preview01.gls-group.eu:8443/backend/backendinfo/name) - the response will inform you about the version:

- All changes mentioned in previous major versions and 4.0 F1 apply as well

Functional changes

- **PNG** can now be requested in **200 dpi** resolution

  - PNG as standalone label format will still create PNG labels in 300 dpi resolution

- **Parcelshop** search findNearestParcelShopForAddress now only returns parcelshops **within the same country**. Due to a legal tax restriction, parcelshops can only be used within the country of the consignee. Therefore, the search has been limited. Furthermore those parcelshops in another country than the consignee's country cannot be used for creating parcels using ShopDeliveryService.

- Changes on webservice **documentation**:
  - Added services T24/48, Signature and LimitedQuantities
